

Practical 9

```
import seaborn as sns
import matplotlib.pyplot as plt

# 1. Load the data
df = sns.load_dataset('titanic')

# 2. FIX: Convert 'survived' from 0/1 to 'No'/'Yes' strings
# This ensures Seaborn treats them as distinct categories with different colors
df['survived_status'] = df['survived'].map({0: 'No', 1: 'Yes'})

# 3. Plot with the new string column
plt.figure(figsize=(10, 6))
sns.boxplot(data=df, x='sex', y='age', hue='survived_status', palette='Set1')

# 4. Final Touches
plt.title('Age Distribution by Gender and Survival Status', fontsize=15)
plt.xlabel('Gender', fontsize=12)
plt.ylabel('Age', fontsize=12)
plt.legend(title='Survived?')

plt.show()
```
